the optimisation of economic systems over time and in an uncertain environment is central to the study of economic behaviour the behaviour of rational decision makers whether they are market agents firms or governments and their agencies is governed by decisions designed to seeure the best outcomes subject to the perceived information and economic responses inlcuding those of other agents economic behaviour has therefore to be analysed in terms of the outcomes of a multiperiod stochastic optimisation process containing four main components the economic responses the dynamic constraints represented by an economic model the objec tive function the goals and their

priorities the conditioning information expected exogenous events and the expected future state of the economy and risk management how uncertainties are accommodated the papers presented in this book all analyse some aspect of economic behaviour related to the objectives information or risk components of the decision process while the construction of economic models obviously also has a vital role to play that component has received much greater or almost exclusive attention elsewhere these papers examine optimising behaviour in a wide range of economic problems both theoretical and applied they reflect a variety of concerns economic responses under rational expectations the lucas critique and optimal fiscal or monetary policies market management partly endogenous goals evaluating government reactions locational decisions uncertainty and information structures and forecasting with endogenous reactions

this volume contains eleven articles which deal with different aspects of dynamic and differential game theory and its applications in economic modeling and decision making all but one of these were presented as invited papers in special sessions organized at the 7th annual conference on economic dynamics and control in london england during the period june 26 28 1985 the first article which comprises chapter 1 provides a general introduction to the topic of dynamic and differential game theory discusses various noncooperative equilibrium solution concepts including nash stackelberg and consistent conjectural variations equilibria and a number of issues such as feedback and time consistency the second chapter deals with the role of information in nash equilibria and the role of leadership in stackelberg problems a special type of a stackelberg problem is the one in which one dominant player leader acquires dynamic information involving the actions of the others followers and constructs policies so called incentives which enforce a certain type of behavior on the followers chapter 3 deals with such a class of problems and presents some new theoretical results on the existence of affine incentive policies the topic of chapter 4 is the computation of equilibria in discounted stochastic dynamic games here for problems with finite state and decision spaces existing

algorithms are reviewed with a comparative study of their speeds of convergence and a new algorithm for the computation of nonzero sum game equilibria is presented
